GA RRT: Mental Health in Farm and Foodservice Workers

Jessica Badour, Colby Brown, Venessa Sims

Georgia Department of Agriculture, Emergency Management and Food Safety Divisions

Georgia Food, Agriculture & Hospitality Project

Background

The COVID-19 pandemic and subsequent shutdowns resulted in job losses and instabilities throughout the world. While unemployment levels were high in all sectors, the agriculture and hospitality industry were among the hardest hit. About two-thirds of restaurant employees lost their jobs during the pandemic (National Restaurant Association). Now, employment is slowly increasing, but is far below the levels before mid-March 2020 (NRA). Farms are closely tied to the service industry, with some farms primarily or solely providing food to restaurants. This has resulted in losses in the agriculture industry as well (Environmental and Resource Economics). Changes in distribution patterns, buying habits, and supply chains have all resulted in losses in the agriculture industry during the pandemic.

There was precedence for necessary action in mental health from the State of Georgia's experiences with Hurricane Michael in 2018. In that time, Georgia saw \$2.5 billion in losses (Georgia Department of Agriculture). A survey conducted following the hurricane showed that about half of adults in rural communities were experiencing more mental health challenges than they were a year ago (GDA). This information exacerbates already higher rates of unaddressed mental health issues in the agricultural community (Safety and Health at Work).

"Our efforts to support workers in agriculture, food and hospitality sectors is a critical response to the unique challenges we are all currently facing," said Georgia Agriculture Commissioner Gary Black. "From devastating hurricanes to this year's global pandemic, our communities are experiencing unprecedented stressors that can have broad and extensive consequences." These known stressors in the agriculture and restaurant industry joined forces shortly after the lockdowns began, in April 2020. They formed Helping Our Service Professionals (HOSP-GA), an initiative created to support coordination and recovery efforts for all food industry workers. The committee hopes to bring light to the mental health issues in Georgia with resources and support efforts that can easily be transferred and replicated within other jurisdictions.

The HOSP-GA Committee has created:

- Video presentation on food insecurity in Georgia
- Articles in the GDA's Market Bulletin
- Social media campaign on the GDA's Twitter and

Digestive issues | Headaches/pain | Easily startled | Rapid heart rate | Sweating or chills | Fatigue/loss of energy | Weakness

Know When to Get Help

While it's normal to feel sad, anxious or worried after a disaster, some may still feel those emotions a year or more after a disaster. If you or someone you know struggles to cope with strong feelings after a few weeks/months or experiences continued interference with normal functioning, get help by accessing one of the resources found on this bookmark.

Deliverables

- Bookmarks and expandable business cards on mental health resources (Figure 1)
- Facebook pages
- Press release on World Mental Health Day
- Electronic survey to assess mental health and helpful resources

Methods

Quantitative data collection includes many steps to ensure an adequate population. These aspects include the following:

Sampling: Surveys were shared over various networks throughout the state and nationally. **Examples:**

Georgia Department of Agriculture Georgia Department of Public Health RRT Programs, nationwide

Georgia Environmental Health Association Association of Food & Drug Officials (and

several of its regional affiliates)

Georgia Food Safety & Defense Task Force

- Distribution: Survey links were sent over email and through scannable QR codes.
- Sample Period: The survey was open from September 4, 2020 to September 28, 2020.
- Sample Size: 430 people completed the survey.

Figure 2. Example of survey informational flyer with scannable QR code

Table 1: Demographics of Survey Respondents				
Gender (t=404)	Female: 58.1% (266)	Male: 27.1% (124)	Rather Not Say: 0.02% (11)	Not Sure: 0.007% (3)
Age (t=404)	20-34: 14% (58)	35-49: 37% (148)	50-64: 39% (159)	65+: 0.09(36)
State (t=458)	Georgia: 59% (271)	Michigan: 14% (64)	Ohio: 12% (55)	Other: 15% (68)

Discussion & Significance

The survey asked respondents to assess their mental health before and after COVID-19. Before the pandemic, the average stress levels were 4.62 on a scale of 1-10. In the two weeks prior to the survey, after the pandemic, respondents reported average stress levels of 6.05 (Figure 5).

Social media influenced the stress of participants. Most respondents reported that social media had at least some effect on their stress levels (Figure 6).

The respondents were also asked about the top contributors to their stress. Many respondents reported fear of exposing their family to the virus (199), physical health (122), and family issues not related to the pandemic (120).

Respondents reported signs and symptoms related to mental distress. The most common was difficulty concentrating (182), followed by forgetfulness (162) (Figure 3). Additionally, participants reported feeling changes to their physical state. The most common was fatigue (191) and headaches (152) (Figure 4).

We found in our results that our target population—food industry workers—were not well represented (statistics here). This could be due to a few reasons. We sent this survey during harvest time, when farmers can be very busy. There also could be a strong desire from other workers to share their experiences with mental health during the COVID-19 pandemic.

Future Actions

There were two main intentions for the mental health survey.

- Raise awareness for mental health in the agricultural and hospitality sector
 - Share the results with GDA's networks
 - Talk about mental health in the agricultural community
- Develop effective resources and materials for mental health
 - Update the GDA's website with results
 - Refine coping mechanisms to better fit the lifestyles of participants
 - Develop agriculture-specific mental health resources

There were 187 participants from states outside of Georgia who participated. This survey has the potential to be replicated in other RRT states.

- Communication materials and press releases can be found on the GDA's website.
- Mental health education posts can be found on the GDA's Facebook and Twitter accounts.
- The survey instrument is in Survey Monkey and can be opened again.

The Georgia RRT is dedicated to helping the lives of its farmers and food producers, in all aspects. This project will help the GA RRT to better serve the state.

A formal report with expanded survey results will be available in the spring of 2020.

The GA RRT is grateful to all its partners who help to create and share this survey and mental health resources. A thank you to: The HOSP-GA Committee, the Georgia Department of Behavioral Health and Developmental Disabilities, the Georgia Department of Public Health, Florida Department

of Agriculture and Consumer Services, Michigan Department of Agriculture and Rural Development, the Washington RRT, the Georgia Restaurant Association, the Georgia Environmental Health Association, National Environmental Health Association, UGA Extension, FEMA, USDA, FDA, CDC, and AFDO and regional partners.
